

Categorization of Cooking Actions Based on Textual/Visual Similarity

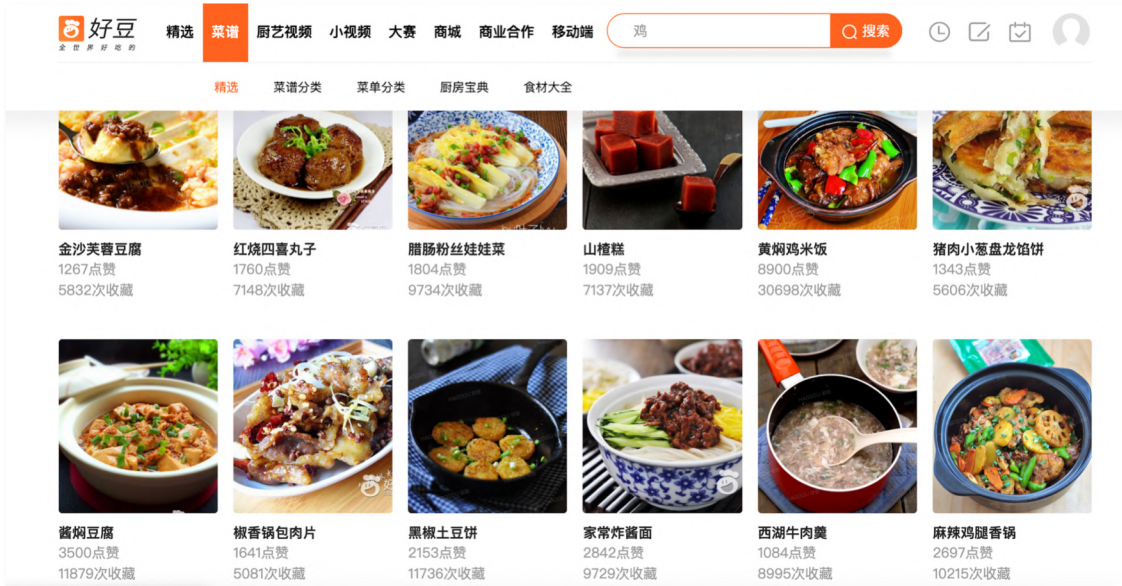

Yixin Zhang¹, Yoko Yamakata² and Keishi Tajima¹

¹Kyoto University and ²The University of Tokyo, Japan

MADiMa 2019

Research Background

1

- 5,482,309 recipes in Chinese
- Every procedural step is associated with an image.
- The pairs of text and image in procedural steps are used in this research.
- 57,361,678 steps in total

Chinese recipe site: 好豆 (Haodou)

The screenshot shows a recipe page for '清炒虾仁' (Stir-fried Shrimp). The title is highlighted with a red box and labeled 'recipe title'. Below the title, there are statistics: 42475 views, 2092 likes, and 31 comments. There are three tags: '快手菜' (Quick Dish), '晚餐' (Dinner), and '爆炒' (Stir-fry). The author is '壹笑嫣然' (Yi Xiao Yanran) with a '+关注' (Follow) button. There are social sharing icons for Weibo, Douban, and others. A paragraph of text describes the recipe: '看上去赏心悦目的清炒虾仁, 做起来却十分省事, 最主要的是在虾仁的处理上, 要想炒出晶莹剔透还是有些讲究的, 配菜选择黄瓜和胡萝卜, 色彩鲜明, 如此炒好的成品非常漂亮。' Below this, there are sections for '主料' (Main Ingredients) and '辅料' (Supporting Ingredients). The main ingredients are 虾仁 100g, 黄瓜 1根, and 胡萝卜 1根. The supporting ingredients are 油 1勺, 盐 1小勺, and 碱面 半小勺. A red arrow points from the text 'Add less baking soda powder to the shrimp and a little salt and mix well, then wash with water, drain, then add the cooking wine and marinate for 10 minutes, then add starch and a little oil to grab.' to the '碱面 半小勺' ingredient. The '清炒虾仁的做法' (How to make Stir-fried Shrimp) section has two steps. Step 1 is highlighted with a red box and labeled 'procedural step'. It says: '1 虾仁中加少入碱面和少许盐抓匀, 然后用清水洗净, 沥水, 再加入料酒抓匀腌制10分钟, 然后加入淀粉和少许油抓匀,'. To the right of this text is an image of marinated shrimp, labeled 'image'. Step 2 says: '2 黄瓜去皮去籽后切成菱形块, 胡萝卜去皮后也改切成菱形块,'. To the right of this text is an image of sliced vegetables.

Word embedding of action verbs in recipes.

- To calculate similarities and differences between action verbs.
 - “Cut” and “Cut into” have similar meanings but the latter one indicates the shape of ingredients after being cut.
- To be used for recipe retrieval or recipe automatic translation.
- Existing method: word2vec
 - Train word-embedding model by recipe text data and transform each verb into a vector.
 - The similarity between two verbs is computed by the cosine similarity of their embedded vectors.

1 青椒洗净后切丝

cut

Wash the green pepper and **cut**.

1 将茄子切成粗条。

cut into

Cut eggplant into sticks.

5 骨汤倒入锅中，大火翻炒均匀，调入盐淋入核桃油即可。

stir fry

Pour the bone soup into the pot, **stir fry** over high heat, and mix in salt and pour in the walnut oil.

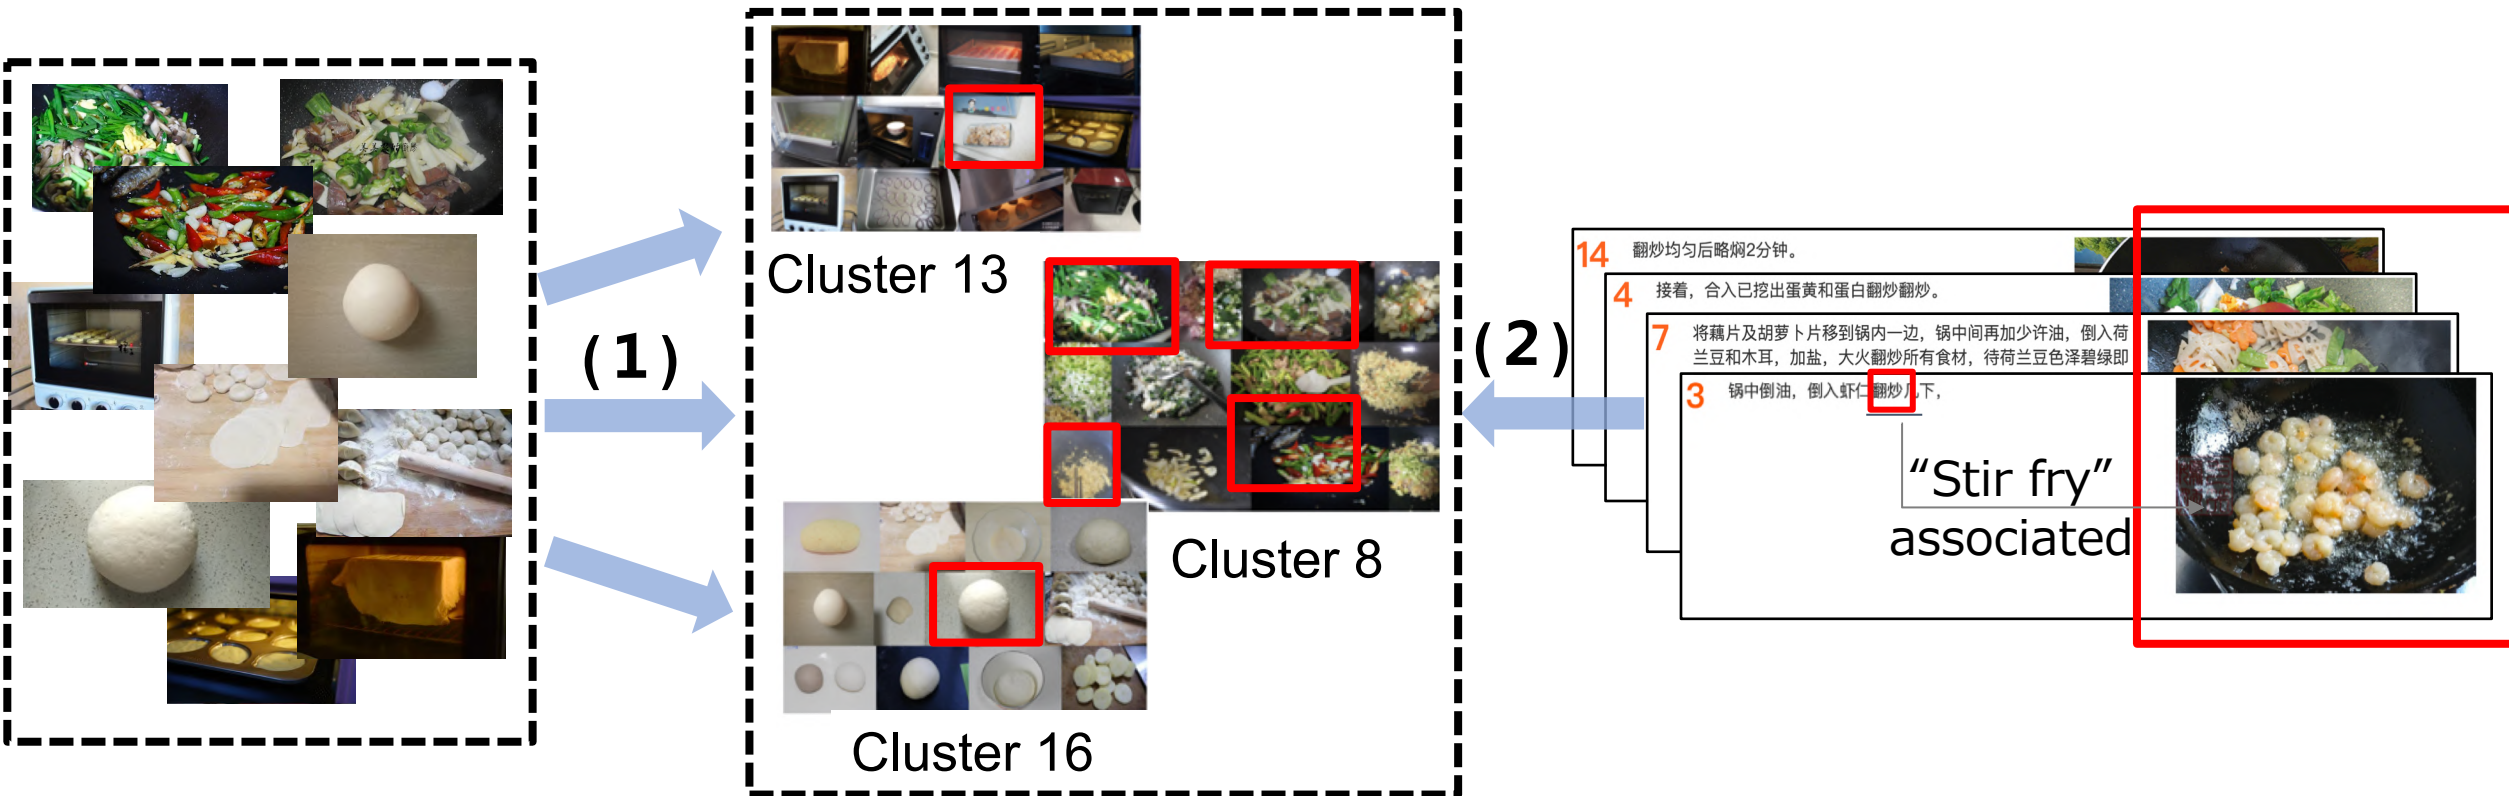

The semantic of “cut” and “cut into” are similar, also the image styles of them are same (ingredients on the chopping board)

On the other hand, the semantic of “cut” and “stir fry” are not similar, also the image styles of them are not similar (latter one: ingredients in the fry pan)

Proposed Method

4

- Word embedding by associated images.
 - (1) Clustering images in our dataset into groups which consist of images of similar style.
 - (2) For each verb, calculating the probability distribution of the associated images over clusters.

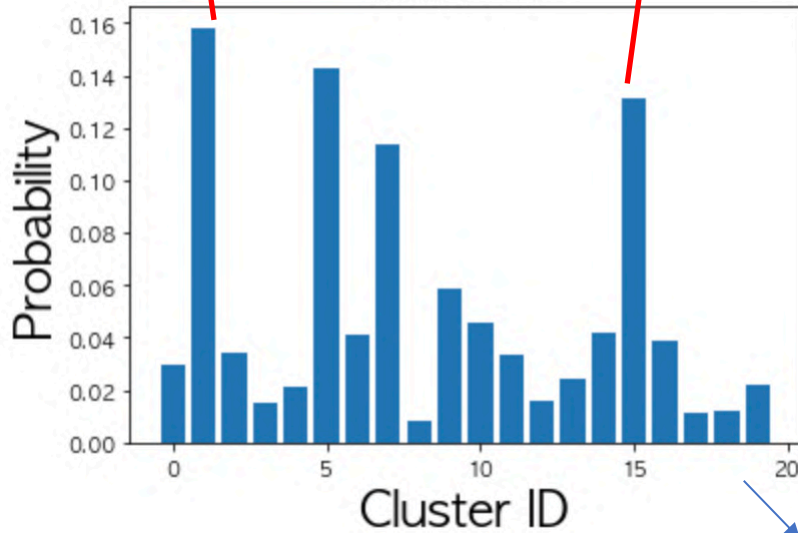

Proposed Method

5

- Probability distribution of associated images over clusters indicates the meaning of the verb.

搅拌(Stir)

切(Cut)

切成(Cut into)

Not similar

Similar

- #Recipes = 12,548

Image clustering method

7

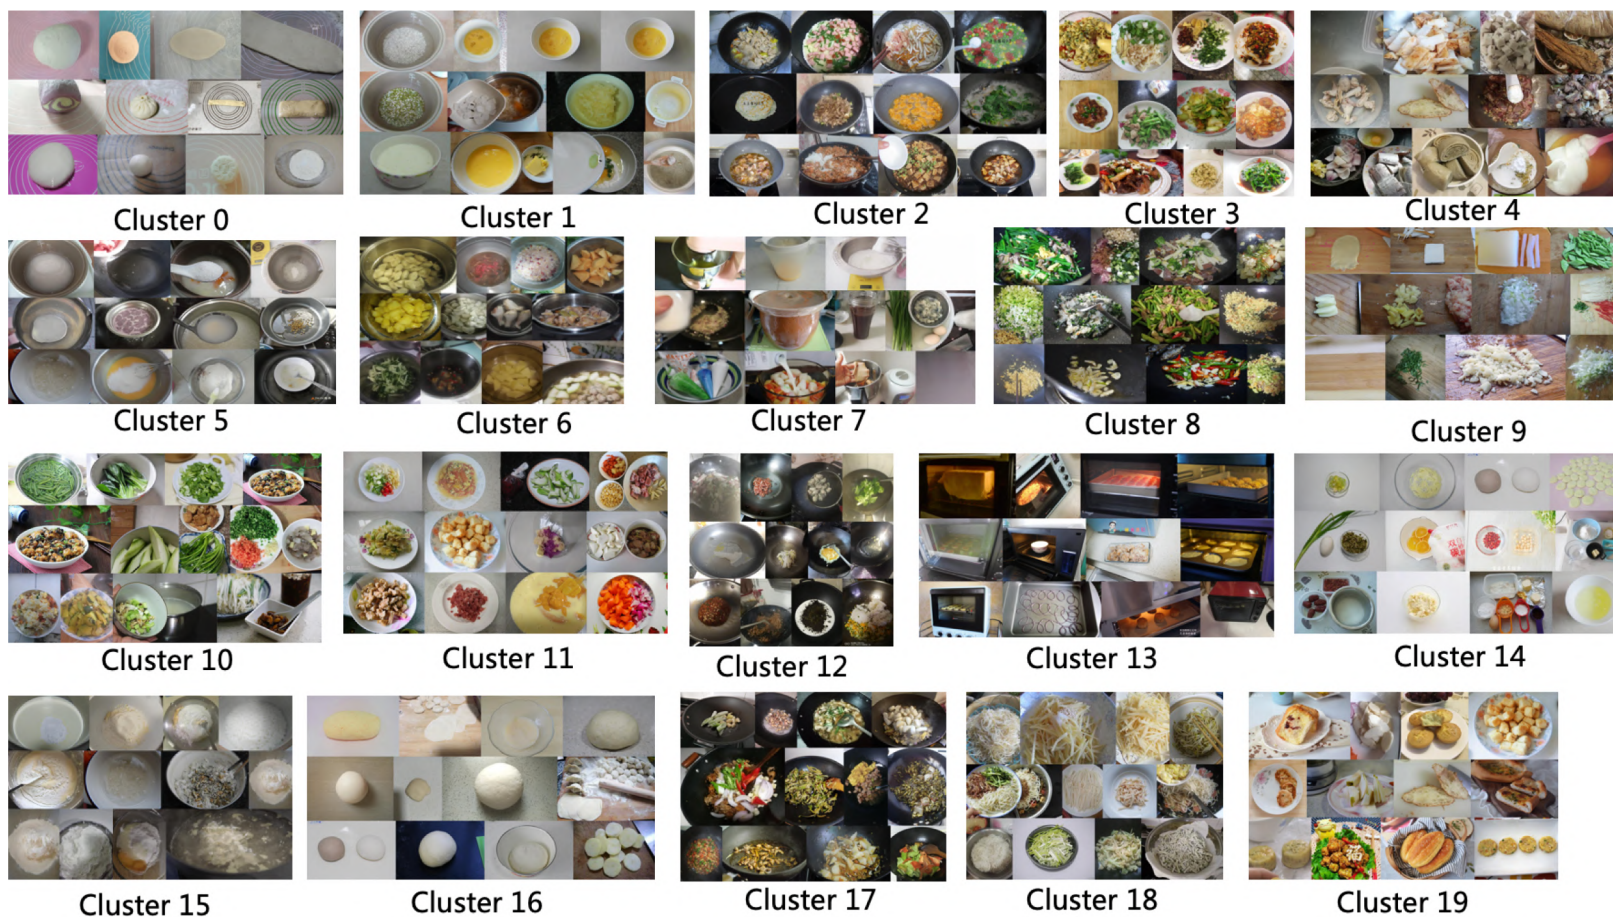

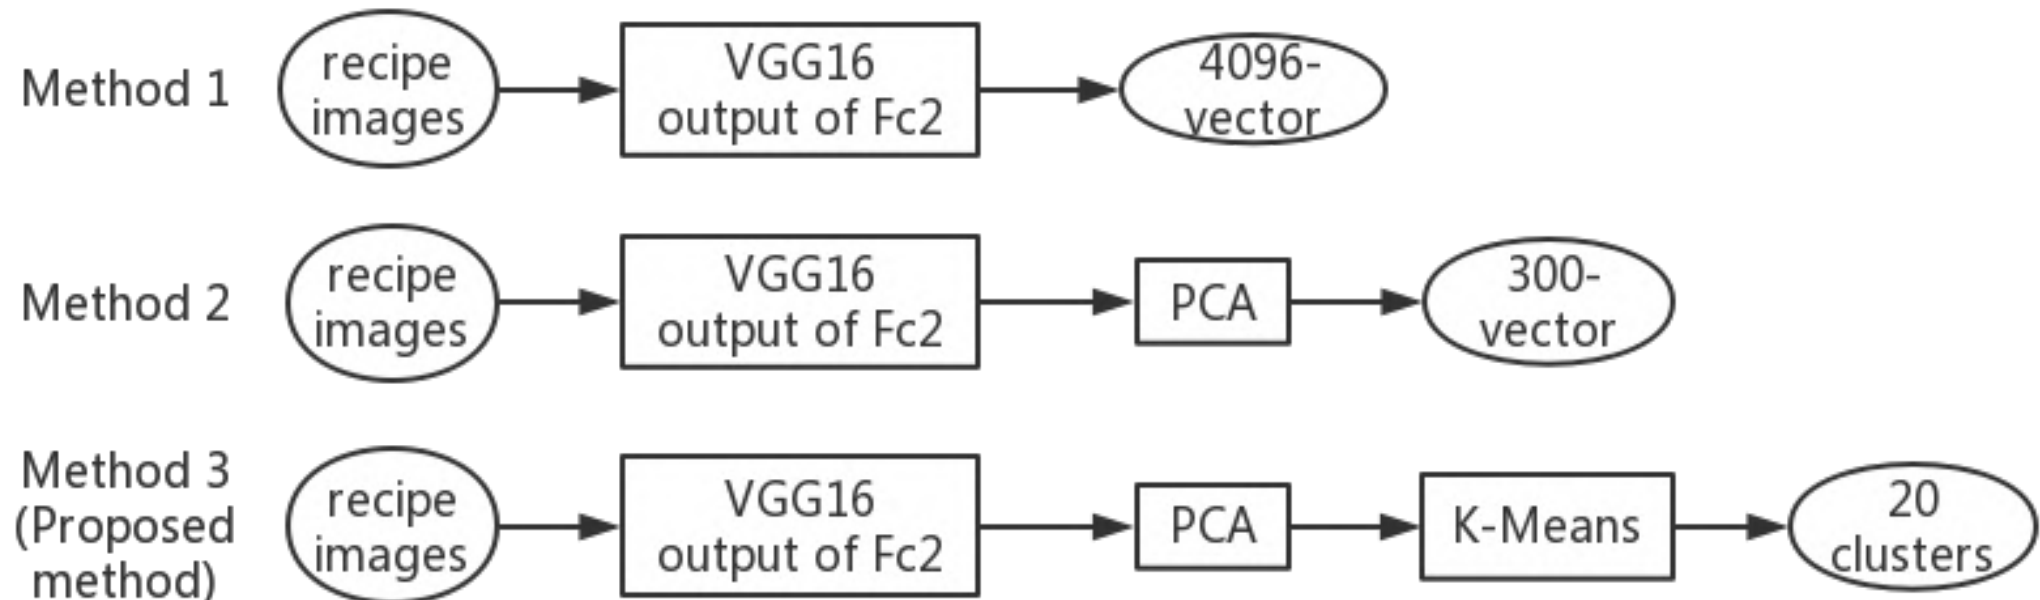

Table 1: The Number of Images in Each Cluster

cluster	#img	cluster	#img	cluster	#img	cluster	#img
00	775	05	3107	10	3468	15	2387
01	3244	06	2574	11	2530	16	1882
02	2561	07	3919	12	1436	17	1685
03	2696	08	2258	13	1123	18	1175
04	2664	09	3529	14	2544	19	2607

- Ground truth: Word2vec
 - To evaluate whether the proposed method achieves word embedding which represents word semantics as word2vec does.
- We compared **three ways** to vectorize verbs.
 - Method 1 and 2 use the image vectors calculated from VGG16 and PCA.
 - Method 3 uses the clusters of recipe images (proposed method).

- Whether image styles contain semantics of associated image.
- Computing top-10 similar verbs by using our three vectorization methods.
- Calculating how many of the top- n results given by our image-based method are also included in the top-10 results given by the word2vec method for $n = 1, \dots, 10$.
- Dimensional compression from 4096 to 20 using image clustering did not cause performance deterioration.

Table 5: Degree of Agreement with Text-Based Method

n	1	2	3	4	5	6	7	8	9	10
4096-vector	10	13	16	21	23	27	29	31	33	35
300-vector	10	13	17	21	24	27	29	31	35	39
20-vector	8	12	18	22	24	26	30	31	32	34

- Producing a 20-dimensional vector for each verb by computing the ratio of each cluster within the set of all images associated with it.
- The heat map represents the ratio of each cluster for 14 example verbs.

- The top-10 results of the word2vec method and the method using the 20-dimensional vectors for the 14 example verbs.
- Text-based (Word2vec) similarity and image-based (proposed method) similarity of verbs are complementary to each other.

boil 煮			
	text		image
1	boil	煮开	put in 放入
2	boil	煮沸	boil 煮沸
3	make soup	煲	boiling water 开水
4	cooked	煮熟	fish out 捞出
5	stew	焖	pour 倒入
6	boil	烧开	add in 加入
7	stew	炖煮	cook 煮熟
8	stew	炖	cooking wine 料酒
9	make soup	熬	stew 焖
10	turn	转	chop 切碎

- Word embedding of action verbs using pairs of text and images in recipes.
- Three methods of vectorizing verbs are compared with Word2vec.
 - Image-based word embedding achieves as good performance as Word2vec.
 - Dimensional compression from 4096 to 20 using image clustering did not cause performance deterioration.
 - Text-based similarity and image-based similarity of verbs are complementary to each other.
- Future work
 - To evaluate our proposed method by manually generated ground truth.
 - To further research on the relevance between textual and visual data.
 - Not only verbs, but also extend our method to other part-of-speech (e.g. adj.)
 - To deploy our method for recipe auto-translation or recipe multi-lingual retrieval.

Thank you
