## Background and aims

- Automatic food volume estimation persists as a challenge with error rates as high as $85 \%$ [1].
- This study undertook a comparison of different methods for automatic food volume estimation harnessing depth maps as a pivotal component.
- A comprehensive dataset of 20 meals, captured at varying distances $(40 \mathrm{~cm}$ and 60 cm ) was curated encompassing reliable ground truth volumes, RGB images, and
 corresponding depth maps.

## Methods

## Results and Conclusions

- LiDAR consistently outperforms other methods, offering reliability and flexibility.
- The stereoscopic sensor, ranking second at 40 cm , could be ideal for controlled environments.
- The geometry-based method excels particularly at 60 cm .
- Neural-based approach shows promise, needing only one image and no specific hardware but may benefit from further fine-tuning.

| Method | Plastic |  | Real |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{6 0} \mathbf{~ m}$ | $\mathbf{4 0} \mathbf{~ c m}$ | $\mathbf{6 0} \mathbf{~ m}$ |  |
| Stereoscopic sensor | 26.15 | 36.41 | 25.06 | 41.07 |
| LiDAR sensor | $\mathbf{2 1 . 3 2}$ | $\mathbf{2 2 . 7 6}$ | $\mathbf{1 7 . 4 5}$ | $\mathbf{1 6 . 4 0}$ |
| Geometry-based | 30.54 | 29.99 | 27.21 | 23.57 |
| Neural-based | 30.40 | 35.61 | 26.41 | 30.25 |

Table 1: Mean absolute percentage errors with different methods

## Acknowledgments

This work was partly supported by the European Commission and the Swiss Confederation - State Secretariat for Education, Research and Innovation (SERI) within the project 101057730 Mobile Artificial Intelligence Solution for Diabetes Adaptive Care (MELISSA)
